- The optimum PC text quality is provided by HD 1080 mode (1920 x 1080, 60 Hz).
- Your PC Display screen might appear different depending on the manufacturer (and your particular version of Windows).
- Check your PC instruction book for information about connecting your PC to a Display.
- If your PC offers vertical and horizontal frequency selection, choose 60 Hz (vertical) and 31.5 kHz (horizontal). In some cases, abnormal signals (such as stripes) might appear on the screen when the PC power is turned off, or disconnected. If so, press the [INPUT] button to enter the video mode. Also, make sure that the PC is connected.
- If the horizontal synchronous signals seem irregular in the RGB mode, check the PC power saving mode or cable connections.
- The Display settings table complies with the IBM / VESA standards, and is based on analogue input.
- The DVI support mode is the same as the PC support mode.
- The best vertical frequency timing for both modes is 60 Hz.
